

Bandit - Level 03

Goal

The password for the next level is stored in a hidden file inside the `inhere` directory, in the home of `bandit3`.

Connection

```
ssh -p 2220 bandit3@bandit.labs.overthewire.org
```

Use the password retrieved at the end of [Bandit - Level 02](#).

Concepts

No new concept — this level is a direct application of `ls -a` (already covered in [Linux - Command Line Reference](#)): files starting with `.` are hidden by default and don't show with a plain `ls`. The filename here (`...Hiding-From-You`) starts with three literal dots, which is just a hidden filename with an unusual name — not a special shell token like `.` (current dir) or `..` (parent dir).

Solution Approach

```
cd inhere
ls -la          # -a reveals the hidden file
cat ...Hiding-From-You
```

Points of Friction

None — solved directly on the first attempt.

Key Takeaway

Confirms `ls -a` as a reflex for any "I know there's something here but I can't see it" situation — the most common reason a file seems to not exist is simply that it's hidden, not that it's actually missing.

Next

```
ssh -p 2220 bandit4@bandit.labs.overthewire.org
```

 using the password found above.
